

Redux dispatching actions

Actions are the way that the State is updated, it is the glue that makes redux work.

We need to dispatch() actions using the dispatch() function that Redux provides us with.

How do we get the dispatch method?

- 1) If using the **connect()** method, dispatch() Will be a prop of your components you passed in.
- 2) If using useSelector hook, you can use the useDispatch hook to get the all import dispatch method:

```
import { useDispatch } from "react-redux";  
const dispatch = useDispatch();
```

Redux Thunk

What is a thunk?

Redux is a strict design pattern in which Actions must return an object with a type

```
export const removeExpense = (id) => {  
  return {  
    type: "REMOVE_EXPENSE",  
    id,  
  };  
};
```
